Visitor Management System

Introduction

The **Visitor Management System** is designed to enhance security, streamline visitor entry and exit processes, and maintain accurate records. By leveraging advanced authentication and monitoring mechanisms, the system ensures a secure and efficient visitor management process.

The **Visitor Management System** enhances security, optimizes visitor handling, and ensures effective monitoring through **QR-based authentication, OTP verification, real-time tracking, and instant messaging**. By offering a comprehensive and efficient approach to visitor management, the system significantly improves security and operational efficiency within the premises.

Objectives

The primary objectives of the system are:

- **Seamless visitor entry and exit**
- **Access control for authorized visitors only**
- **Retention of historical visitor records for future reference**
- **Real-time monitoring and tracking of visitor movements within the premises**

System Overview

The proposed **web-based application**, with **mobile integration**, provides a user-friendly interface accessible across multiple devices. During the initial visitor registration, the system securely records the following details:

- **Full name and contact information**
- **Photograph**
- **Identification proof**
- **List of items carried during the visit**

Visitors are categorized into different groups, such as **VIPs, Customers, Vendors, and Job Candidates**, allowing tailored entry and exit permissions based on their classification.

Key Features

1. Multi-Device Accessibility

Security personnel can operate the system using **computers, tablets, or smartphones**, ensuring flexibility and ease of use.

2. Pre-Scheduled Appointments

Hosts can schedule visitor appointments in advance, enabling a seamless check-in process and reducing wait times.

3. Secure Check-In and Check-Out Process

- Security personnel can **monitor and regulate visitor entry and exit** in real time.
- **Host approval is required** before a visitor leaves the premises.
- A **configurable checkout time limit** ensures security personnel can track visitors who exceed the permitted duration, triggering automatic alerts if necessary.

4. QR Code-Based Authentication

- Visitor registration is **validated via QR code** for enhanced security.
- Once registered, visitor details are **permanently stored**, eliminating the need for repeated registrations.
- Future visits are authenticated through an **OTP-based verification system**, requiring host approval.

5. Real-Time Monitoring and Historical Record Keeping

- **Authorized personnel** can track visitor status at any time.
- The system securely retains **historical visitor records**, which can be accessed as needed by approved authorities.

6. Instant Messaging and Notifications

- The system includes an **instant messaging feature** that enables real-time communication between **SWIL employees** and visitors.
- Alerts and notifications ensure smooth coordination during the visitor's stay.
